

Facial Cosmetic Surgery

Facial cosmetic surgery has been employed for many years in the correction of deformities of the facial soft tissue and bone. Oral and maxillofacial surgeons for many years have been involved in the treatment of these deformities. Many people seek facial cosmetic surgery not only for the correction of congenital or disease related deformities, but also to reverse the process of aging. Oral and maxillofacial surgeons during their hospital based surgical residency are trained and qualified to perform most facial cosmetic procedures including such as cheek implants, chin surgery, eyelid surgery, ear surgery, face and neck liposuction, etc..
